

BONUS

Supports the regeneration of the skin layers

Supplementary feed for cattle

Mortellaro (lat. dermatitis digitalis) is a common bacterial disease of the hooves of cattle. Specific symptoms are inflammation of the skin, mostly in the area of the pastern. Due to the pain this causes, the animals begin to lame, they eat less feed, milk yield and fertility decrease. All this is accompanied by high economic losses. In addition to poor stable and hoof hygiene, this hoof disease is also promoted by a warm, humid environment or inadequate feeding.

BONUS supports the regeneration of the skin layers in Mortellaro by:

- it goes to the base from the inside and thus reduces the proportion of acute M2 disease
- this in turn means a relative shift towards the M4 stage, the animals can walk without pain and feed intake remains constant
- carrier animals can also remain on the farm

Dosage:

BONUS is mixed into their mineral feed and is not available as a single product.
