## DEVIL'S CLAW

Natural support for joint problems

A purely natural product

Has positive effects especially on the muscular, ligamentous and on the joint apparatus

Can also have a supportive effect in laminitis and hoof roll

Has an anti-inflammatory and decongestant effect

Devil's claw is still considered a rather unknown horse supplement in Germany, although it provides support for many problems and has been used for thousands of years in other countries as a medicinal plant for humans and animals. It has a particularly positive effect on the horse's muscle, ligament and joint apparatus, as it inhibits protein-degrading enzymes and can thus protect the cartilage. This makes it particularly suitable for horses that already have arthrosis or are already burdened by injuries and thus have an increased risk of joint wear. It is also considered to be a particularly effective support for injuries to the fetlock, hock and knee joints. In addition, it is considered to be a particularly effective support for injuries to the fetlock, hock and knee joints, but also for laminitis and hoof rolls. Tendonitis and tendon injuries also benefit from the positive effects of the plant when used as an accompanying therapy. As it is a natural remedy, important organs such as the liver and kidneys are not damaged and it is therefore also suitable for long-term administration, which should, however, be discussed with the vet.

**Feeding recommendation:** Devil's claw should be fed regularly and continuously; however, not permanently or over a longer period of time, as it can lead to lesions on the stomach lining. We therefore recommend giving it as a course of treatment. Devil's claw can also be added to mash or soaked in warm water. It is not suitable for horses with a sensitive stomach and pregnant mares. Consult your veterinarian when supplementing the feed.

**Packing:** 1 kg bucket
